mptom table mirrors that used in this standard are only designed to tem failures, not the cause of them this would be extremely haustive. This standard helps ure symptom reporting across t instruct or guide duty holders on specific contradictions that have ld be welcomed as feedback for . In your example, being unable to ld be recorded as a high risk event able from a driver's perspective, naller). As you rightly state in your fault that could result in a REC plicable parties is High risk" high risk fault, with the failure a REC cannot be established. s is subtle wording and hence why CAS needs to consider faults and ures.

e not been included into the risk classifications in the Appendix ilures are akin to wrong-side intended REC would not fall in to.
